

FOR FRESH GRADUATES & CAREER STARTERS

Build useful automations from day one.

Learn how everyday business work becomes repeatable workflows—and build evidence you can explain in a portfolio, interview, or career conversation.

New to IT or automation?

Start with the building blocks. Progress through guided projects. You do not need to arrive as a programmer or an expert.

YOU WILL BUILD

15–25

Mini projects for your portfolio

Days of guided learning

PROGRAMME FEE

₹16,999

Complete job-ready curriculum

WHAT STUDENTS NEED TO SEE FIRST

A clear route from *first workflow* to professional evidence.

The programme combines foundations, business automation, advanced frameworks, agentic concepts, and project delivery into one structured learning journey.

Who this is for

Fresh graduates, career starters, and learners moving toward automation roles who want a guided path from first workflow to portfolio evidence.

Practise by doing

Follow guided class tasks, build workflows, work through RPA Challenge-style practice, and turn each topic into a demonstrable automation example.

Build a portfolio

Document the business problem, workflow logic, inputs, outputs, exception strategy, and result so your work can be explained in a portfolio or interview.

Prepare for the next role

Use project explanations, interview preparation, profile support, and structured learning progress to present a stronger automation-career story.

STUDENT PROMISE

Students do not only finish lessons. They leave with workflows they can explain.

Learn the concept • practise the tool • build the project • show the evidence.

How the learning experience works: Live, interactive delivery is supported by recordings, daily tasks, guided practice, project discussions, and a step-by-step progression from beginner concepts to advanced automation.

PHASE 01 • START WITH THE BUILDING BLOCKS

Foundation skills that make the *first automation* possible.

Begin with the Studio environment, workflow thinking, variables, selectors, and the first reusable automation patterns.

01

UiPath Studio Explanation

Understand the Studio interface, projects, panels, activities, and the working environment used to create automations.

02

Introduction to Variables

Learn how variables hold values, support workflow logic, and help move information between activities.

03

Introduction to Arguments

Use arguments to pass information between workflows and create more reusable automation components.

04

Selectors

Recognise how UiPath identifies interface elements and how reliable selectors support stable automation.

05

Selectors & Excel Automation

Connect interface targeting with structured spreadsheet work and practise a repeatable business workflow.

06

Excel & Workbook Automation

Read, write, update, and organise Excel data using workbook and application-based automation patterns.

STUDENT RESULT

Explain Studio, variables, arguments, and selectors without relying on memorised steps.

PRACTICE EVIDENCE

A first workflow that reads structured input and produces a visible output.

KEY LANGUAGE

Projects · activities · variables · arguments · selectors · workbook.

PRACTICE LAB & EXIT CHECK: Build a first workflow that reads structured input, uses variables and selectors, and returns a visible output. Explain where each value is stored and how the target is identified before extending the workflow.

PHASE 01 • TURN FOUNDATIONS INTO WORKFLOWS

Build useful automations across *business applications*.

Move from basic building blocks into web interaction, data capture, workflow logic, and practical business scenarios.

07

Word Automation

Generate, update, and organise business documents through structured automation steps.

08

Web Automation

Work with browser-based applications using reliable interaction patterns and visible workflow logic.

09

Web Data Extraction

Capture information from web pages and turn it into structured, reusable business data.

10

Web Recording & Scraping

Use recording and scraping approaches to accelerate repeatable browser-based data workflows.

11

UiDemo Application Project

Apply the early topics in a guided UiDemo application project that connects interaction, data, and process steps.

12

Directory Search Application Project

Practise a realistic application scenario and explain the workflow from input through output.

STUDENT RESULT

Build workflows that interact with documents, browsers, and structured business data.

PROJECT EVIDENCE

UiDemo and Directory Search scraper examples that can be discussed in a portfolio.

CORE PROMISE

Learn how a business process becomes a repeatable, resilient automation.

PRACTICE LAB & EXIT CHECK: Automate a small browser-to-document flow using web interaction, extraction, and a clear output step. Identify the input, interaction, data captured, and business result produced.

PHASE 02 • WORK WITH BUSINESS INFORMATION

Data, documents, and *workflow logic* that stand up to real work.

Develop data-handling habits: clean inputs, controlled flow, readable strings, date operations, and practical file movement.

13

Variables Continued

Deepen variable usage across workflows and choose suitable data structures for business scenarios.

14

Programming & Control Flow

Use conditions, loops, switches, and workflow decisions to create predictable automation behaviour.

15

String Manipulation

Clean, split, join, compare, and transform text so automations can handle everyday business inputs.

16

Report Mover Bot

Build a practical file-processing pattern for moving, organising, and routing reports dynamically.

17

DateTime Operations

Work with dates, times, formats, and calculations that support operational automation.

18

Debugging & Logging

Use breakpoints, output, and logs to understand workflow behaviour and troubleshoot efficiently.

DOCUMENT UNDERSTANDING & AUTOMATION HUB

Extend document-focused workflows with structured extraction.

Build a clearer path from captured information to downstream business automation and enterprise workflows.

THINK LIKE AN AUTOMATOR

Ask what data enters, what changes, what must be checked, and what output proves success.

USEFUL PRACTICE

Transform messy text, move reports, calculate dates, and make decisions in a controlled flow.

STUDENT RESULT

Workflows that are easier to read, test, debug, and explain to technical leads.

PHASE 02 • BUILD FOR REPEATABILITY

Make automation *robust*, connected, and maintainable.

Move from one-off workflows toward data structures, exception strategy, enterprise patterns, and controlled automation delivery.

19

Exception Handling

Anticipate failure, handle exceptions deliberately (Try/Catch/Finally), and keep the workflow understandable.

20

OS Automation

Use operating-system interactions to support file, folder, application, and desktop process automation.

21

DataTables

Store and work with tabular information inside workflows for filtering, looping, and business processing.

22

Excel Automation

Extend spreadsheet automation with structured workbook actions and repeatable data-processing patterns.

23

REFramework

Understand the reusable enterprise framework approach for transaction-based, resilient automations.

24

Assets & BOT Deployments

Connect automation design with deployment thinking, reusable configuration, and operational readiness.

WHY IT MATTERS

Reliability is what separates a demo workflow from an automation people can trust.

FRAMEWORK LENS

Input · transaction · exception · retry · output · deployment.

STUDENT RESULT

Explain how an automation should behave beyond the happy path.

PRACTICE LAB & EXIT CHECK: Design a transaction flow with tabular input, exception handling, and a reusable framework view. Explain the difference between a happy-path demo and an automation designed for repeatable operation.

PHASE 03 • CONNECT THE AUTOMATION ECOSYSTEM

From framework thinking to *connected delivery*.

Learn the integration and delivery topics that help students understand how automations connect to business systems and cloud platforms.

25

Power Automate Cloud

Explore cloud-based workflow automation and how it supports broader business process connections.

26

Power Automate Desktop

Understand desktop automation patterns and how they complement UiPath-oriented workflow thinking.

27

API Automation

Work with service connections and API-based thinking to move beyond screen-only automation.

28

Regex & Integrations

Use pattern matching and integration concepts to handle structured text and connected business scenarios.

29

Debugging & Control Flows

Bring troubleshooting, flow design, and system thinking together in more complex automations.

+

Delivery Mindset

Learn to describe not only what the bot does, but how it connects, fails, recovers, and is maintained.

TOOLS IN VIEW

UiPath • Power Automate Cloud • Power Automate Desktop • APIs • Regex.

STUDENT RESULT

Understand multiple automation surfaces and when each is most useful.

PORTFOLIO ANGLE

Explain the integration choice behind a project, not only the final screen.

PRACTICE LAB & EXIT CHECK: Choose the right automation surface—desktop, cloud, API, or Regex—for a connected business workflow. Explain why the selected tool or integration is appropriate and how it will be maintained.

PHASE 03 • SHOW WHAT YOU CAN BUILD

Finish with *agentic concepts*, real projects & a professional story.

The final classes connect platform knowledge, project thinking, and future-facing automation concepts into a clear next step.

30

Agentic Automation & Real-Time Projects

Explore agentic automation concepts and connect learning to real-time, project-oriented practice.

31

Microsoft PAD & Automation Anywhere

Gain interface-level exposure to adjacent automation tools and broaden your multi-platform awareness.

32

Portfolio Track

Organise project examples around problem, process, tools, logic, testing, exceptions, and outcome.

33

Advanced Automation Readiness

Bring together frameworks, cloud, integrations, projects, and communication for the next interview.

CAPSTONE EVIDENCE

What students should be able to show:

A working automation, a clear project explanation, a reasoned tool choice, an approach to testing and exceptions, and the confidence to discuss what they built.

BUILD

Turn classes into working project evidence.

EXPLAIN

Describe the workflow and technical choices clearly.

SHOW

Present the result in a portfolio or interview.

CAPSTONE CHECKPOINT: Present the project problem, tool choice, workflow logic, testing approach, exception plan, and result. Leave with a project story that can be explained in an interview or career conversation.

THE DIFFERENCE BETWEEN LEARNING AND BEING READY

Build work you can *talk about*.

Students get a structured route to convert class topics into practical tasks, project examples, and a clearer professional profile.

Project and Learning Support

- Step-by-step topic guidance across all 33 classes.
- Daily recordings for revision and continued reference.
- Progress tracking, daily tasks, and guided practice.
- 30–40 guided tasks plus 15–25 mini projects.
- RPA Challenge-style practice and real-time project explanations.
- UiPath Academy certification guidance and progress tracking.

Portfolio & Career Support

Portfolio Direction:

Document business problem, input, output, workflow logic, tools used, exception strategy, testing approach, and improvement.

Career Support:

Mock interviews, resume preparation, LinkedIn and Naukri profile setup, job-application support, interview questions, and portfolio development.

01**Build**

Turn class topics into working workflows.

02**Test**

Review inputs, outputs, and exceptions.

03**Explain**

Describe the process and design decisions.

04**Show**

Present the project in your portfolio.

NEXT CONVERSATION

Ready for a more structured automation-career story?

Use your course progress, project evidence, and practical explanations to start the next conversation with greater clarity.

BEFORE YOU BEGIN

The curriculum is detailed. Your next step can be *simple*.

Use the questions below to decide whether the delivery model, learning support, and course depth fit your goal.

Is the training online or offline?

It is a live online programme delivered through interactive video-conferencing sessions.

Do I need programming experience?

No. The course starts with foundations and builds gradually toward advanced automation topics.

Are recordings included?

Class recordings are provided for revision and continued reference with lifetime access.

Is certification support included?

The curriculum includes course-completion certification and UiPath Academy guidance.

When are batches held?

The curriculum describes weekday morning batches designed for focused, consistent learning.

How do I ask about enrolment?

Use the RPA Vault contact page to discuss course fit, batch options, and your learning goal.

EXPLORE

Explore the full course
